@enzosoti/agents — Installation & Usage Guide

A drop-in modular AI agent framework & skills package for software engineering teams

---

1. Overview

@**enzosoti/agents** provides an automated distribution mechanism for engineering agent skills. When installed via npm, the embedded .agents/ directory is automatically placed into the root of the target repository, allowing AI coding assistants (Antigravity, Cursor, Claude, Copilot) to immediately leverage architectural blueprints, review checklists, and TDD playbooks.

2. How to Install

Option A: Install Directly from GitHub (Recommended for Teams)

```
npm install https://github.com/EnzoSoti/agents.git --save-dev
```

Option B: Use via npx without adding to package.json

```
npx https://github.com/EnzoSoti/agents.git
```

Option C: Install from npm Registry

```
npm install @enzosoti/agents --save-dev
```

3. CLI Commands & Selective Installation

You can manage, inspect, or install specific skills selectively rather than copying the entire library:

```
# List all 20 available skills with indexing
npx agents list

# Install specific skill(s) only
npx agents add tdd bug-hunter
npx agents add ui-ux-pro-max ui-styling

# Full synchronization of all skills
npx agents install --all

# Generate IDE pointer files (.cursorrules, CLAUDE.md)
npx agents link
npx agents link --cursor
npx agents link --claude

# Force overwrite modified files in target project
npx agents install --force
```

4. How the Auto-Install Engine Works

Installation executes bin/install.js via the npm postinstall lifecycle hook:

- **Host Discovery:** Checks INIT_CWD (populated by npm/yarn/pnpm) and parent directories to find project root.
- **Safety Guard:** Non-destructive by default during automated npm installs to avoid erasing developer modifications.
- **Self-Copy Prevention:** Detects when executed inside the source repository and prevents circular copies.

5. Complete Skills Catalog (20 Built-in Skills)

The package includes 20 specialized skill engines covering the software lifecycle:

Skill Name	Domain / Category	Core Functionality
universal-dev-orchestrator	Orchestration	Idea-to-production operating system: spec, vertical slicing, TDD, review gates, multi-agent protocol.
codebase-audit-pre-push	QA & Security	Deep pre-push scan: removes junk files, dead code, secrets, and checks release health.
poka-yoke	Engineering Safety	Mistake-proofing patterns: self-announcing errors, URL deduplication, defensive contracts.
diagnosing-bugs	Debugging	Systematic root-cause isolation loop for complex regressions, race conditions, and faults.
bug-hunter	Debugging	Methodical defect discovery, stack trace inspection, patch construction, and regression guards.
five-axis-code-review	Code Review	Five dimensions: Correctness, Security, Readability, Performance, Test Coverage.
tdd	Testing	Test-Driven Development methodology: red-green-refactor, mocking strategies, unit & integration tests.
performance-optimizer	Optimization	Bottleneck profiling, payload compression, bundle chunking, query cache tuning.
api-endpoint-builder	Backend	Production REST endpoints with validation schemas, RBAC auth, structured error responses.
ui-ux-pro-max	UI/UX Design	79 searchable styles, 192 product palettes, 74 font pairings, 119 usability heuristics.
ui-styling	UI Components	Tailwind CSS utility patterns, Radix/shadcn inspired components, dark mode theming.
design-system	Design System	3-tier token architecture (primitive -> semantic -> component), CSS vars, slide generation.
brand	Branding	Visual identity compliance, tone of voice, messaging frameworks, asset governance.
banner-design	Creative Assets	Social media, marketing ads, and web hero graphics with 22 aesthetic styles.
design	Creative Assets	Logo generation, Corporate Identity Programs (CIP), slide decks, vector graphics.
slides	Presentations	Strategic executive HTML slide decks with embedded Chart.js and token styling.
prototype	Prototyping	Rapid throwaway prototyping for validating state logic and experimental interfaces.
improve-codebase-architecture	Architecture	Codebase deepening opportunities, seam analysis, coupling reduction, visual HTML reports.
technical-change-tracker	Continuity	Structured JSON change records, state machine tracking, cross-session AI handoffs.
fct-app-v4	Architecture Map	Full system map for FCT App: React 19, TypeScript, Power Apps Code App, module routes.

6. Maintenance & Team Updates

To update the skills across any project consuming this package from GitHub, run:
• **Standard update:** npm update https://github.com/EnzoSoti/agents.git
• **Sync via npx:** npx https://github.com/EnzoSoti/agents.git update
• **Force fresh version:** npx agents install --force

7. Document Landing Taxonomy & AGENTS.md

Every installation automatically injects AGENTS.md into the target project root, enforcing strict file-landing taxonomy for all AI agents. No loose markdown or Word files may reside in the root or docs/ root; all documentation must land in dedicated numerical categories (docs/01-user-manuals/ through docs/07-sprints-and-releases/, backend-requests/, etc.).
